

LINKEDUD

INTRODUCTION

LinkedUD is an application that allows you to find a job quickly and efficiently without having to leave home. On LinkedUD you can create a professional profile, apply for jobs that match your profile and be immediately notified when employers give an answer

METHODS

1. User stories: It allows us to know what the end customer is looking for when using the application.
2. UI design: These are the interfaces that will interact with the user
3. Backend development: Develop the infrastructure of the program logic
4. Frontend development: Develop user interfaces
5. Unit tests: They help us check the operation of each method individually
6. Application launch: It is the deployment of the application after performing the unit tests
7. Application support: What errors can occur when running the application

GOAL

The purpose of LinkedUD is to develop an efficient and scalable application over time where users can acquire a job more easily and can adjust their professional profile as they like. We will use programming techniques to create a program that does not usually have errors and that the user is kept safe and updated on all software changes we may make to add functionality. We will use SOLID principles, diagramming and unit testing to ensure the best user experience
